

Measure Authoring Tool Release Notes

Version 4.3.3
January 8, 2016

Table of Contents

DEFECTS FIXED	3
2.1 RESTRICTED CHARACTERS NOW PERMITTED IN MEASURE DETAILS	3
2.2 ITEM COUNT	3
2.3 UUID FOR HQMF IDENTIFIERS	3

Defects Fixed

The Measure Authoring Tool (MAT) version 4.3.3 release includes HQMF updates described below and an update to the Measure Details section. These changes do not impact the MAT user guide.

2.1 Restricted Characters Now Permitted in Measure Details

A security change was implemented with the MAT version 4.3.0 release to remove entries using any combinations of "<", ">", "<=", and ">=". The use of these symbols could potentially allow unwanted computer code entered by a user to be executed within the MAT system. Following the MAT version 4.3.3 release, these characters will be permitted for use in the Measure Details text fields.

2.2 Item Count

Within the HQMF export file, the applicable QDM elements for all entries in the Item Count selected in Measure Details were not being retained in the data criteria section. Now All QDM elements selected as an Item Count in Measure Details are retained in the data criteria section.

2.3 UUID for HQMF Identifiers

There are certain entries within the Data Criteria section with the HQMF that used an integer for identification purposes. To align with the HL7 specification this is changed to a UUID. This creates consistency within the measure and with the HL7 specification.
